Modeled by quadratic-based Bayesian functions in terms of all the attributes, the time-varying multivariate risk analysis under this scenario is carried out in a fully nonstationary condition. Figure 9 a illustrates the time-varying joint return period plots at the three selected time frames under this scenario.

Bayesian analysis for the covariance matrix of a multivariate normal distribution has received a lot of attention in the last two decades. In this paper, we propose a new class of priors for the covariance matrix, including both inverse Wishart and reference priors as special cases.

The commonly adopted Bayesian setup involves the conjugate prior, multivariate normal distribution for the regression coefficients and inverse Wishart specification for the covariance matrix. Here we depart from this approach and propose a novel Bayesian estimator ...

Bayesian Inference of a Multivariate Regression Model

We present a Bayesian analysis of a piecewise linear model constructed by using basis functions which generalizes the univariate linear spline to higher dimensions. Prior distributions are adopted on both the number and the locations of the splines, which leads to a model averaging approach to prediction with predictive distributions that take into account model uncertainty.
