Clinical implications of interferon NAb's. Whether NAb's conclusively diminish or abrogate the therapeutic effects of beta-interferons has been a subject of much debate [8]. Nevertheless, it appears that persistently high NAb titers are associated with a negative impact upon the therapeutic effects of beta-interferons [9,19,25,30,38].

Interferons are a group of signaling proteins made and released by host cells in response to the presence of several viruses. In a typical scenario, a virus-infected cell will release interferons causing nearby cells to heighten their anti-viral defenses. IFNs belong to the large class of proteins known as cytokines, molecules used for communication between cells to trigger the protective defenses of the immune system that help eradicate pathogens. Interferons are named for their ability to "int

SUMMARY Tremendous progress has been made in understanding the molecular basis of the antiviral actions of interferons (IFNs), as well as strategies evolved by viruses to antagonize the actions of IFNs. Furthermore, advances made while elucidating the IFN system have contributed significantly to our understanding in multiple areas of virology and molecular cell biology, ranging from pathways ...

A report in this issue of Clinical Infectious Diseases from Professor Kwok-Yung Yuen and colleagues demonstrates that SARS-CoV-2 induces very weak expression of interferons (IFNs) in infected cells [3]. This absence of IFN production likely hampers the early innate immune response to SARS-CoV-2 infection.
